## PROJECT REQUIREMENTS

Synectics Solutions provides national and international organisations with complex, data management and software solutions that help their clients to harness the power of their data to best effect. Their technology includes products utilised in the identification and prevention of fraud.

Their existing flat build website was not offering the performance, style or presentation of content that this client required. DyNNamite was tasked with developing a new responsive website using the DNN platform that reflected leading edge design and corporate branding parameters.

## THE SOLUTION

The DNN CMS platform is renowned for the flexibility that is inherent in its modular structure. This proved invaluable given the complexity of this complete website design and rebuild undertaken by DyNNamite.

The work undertaken involved migrating content and assets from the existing Synectics Solutions website to repopulate the new DNN site being developed. This included numerous sections of text and visuals on products and industry sectors which have been presented to perfection and made easily accessible via the easy-to-navigate DNN environment.

The result is a DNN site that offers exceptional UX and a presentation of content that synergises perfectly with the high level technological and data management expertise of the client. Using our specialist DNN skills, DyNNamite achieved a highly successful outcome.

“ We were proud to be asked to work with Synectics to create a website reflecting their status as industry leaders in their field. ”

Andrew Libra, DyNNamite
