WEBSITE DEVELOPMENT

Project Requirements

QHS, a well-established, family-owned heating engineering company, has been trading for nearly three decades. Their clients, including local authorities and large housing associations, require 24/7 access to QHS staff to ensure rapid response times for their residents. In 2018, QHS needed a website that would reflect their professionalism and status while providing an easy-to-manage content management system (CMS).

The Solution

We designed and built the QHS website using the DNN platform, which offers a robust and user-friendly CMS. The website design highlighted QHS's long-standing expertise and reliability, incorporating elements that showcased their professional services. After the website was launched, we provided comprehensive training to the QHS marketing team on DNN administration, enabling them to manage the website effectively. We also continue to host the website and provide ongoing support.

The Outcome

The new website successfully reflects the professionalism and status of QHS, enhancing their online presence. The easy-to-use CMS has empowered the marketing team to manage and update the site independently, ensuring content remains current and relevant. The continuous support and hosting services we provide have ensured the website's reliability and performance, meeting the needs of QHS and their clients for quick and efficient access to information and services.
